

Known Limitations

A single place to track the app's current rough edges, intentional design choices, and not-yet-built features. Each entry is tagged:

- **[by design]** — intentional; behaves this way on purpose.
- **[gap]** — a rough edge worth fixing eventually.
- **[not built]** — planned or absent.
- **[WAI]** — working as intended, but surprising enough to call out.

Where a workaround exists it's noted in *italics*.

Import Project

See Import Project.

- **Camera + globals aren't imported** — camera + camera moves, color grade, background/HDRI, and feedback are skipped; the host scene keeps its own. (Fog and particles **are** imported, opt-in — fog only when the host has none.) **[by design]**
- **Imported spin/orbit import as baked keyframes** (the live rate markers aren't), so they stop at the source's duration. Recover the editable, host-length rate via the bundle header's **Extend Spin/Orbit to End** (re-reads the source file). **[by design]**
- **A referenced model file missing on disk blocks the import** — rather than mis-map the (positional) per-object restore, the import is refused with a message naming the missing file. Restore the file or fix its path. **[by design]** (*was a silent mis-map bug; fixed.*)
- **Old project files saved before the per-instance `modelPaths` fix** import only partially. **[gap, legacy]**

Looping — Repeat to Fill Timeline

See Timeline Editor ▶ Import bundles.

- **No "stop after N repeats"** — fill-to-end is the only mode. **[not built, deferred]** (wanted eventually for machinery that stops).
- **No seam smoothing** — each repeat is a hard cut back to the import's frame zero; you author the source so its last frame returns to its first. **[by design]**

Glue & Export Model

See Glue.

- **Nested envelopes** (gluing a unit into a larger unit) work in the transform system but aren't exposed in the Glue dialog. **[not built]**
- **Export Model is baked** — a re-imported glued unit comes back as a flat multi-part model with **no joint hierarchy**; its parts can be spun and keyframed but **not orbited independently**. *Workaround: keep the original project with the live envelope for full per-member freedom.* **[by design — Forward Kinematics will address this]**

Path Animators

See Orbit · Spin · Curve · Linear.

- **Curve and Linear write a *world* pose** — intended for root objects (cameras, lights, ungrouped models), not glued children. **[by design]**
- **Orbit / Spin / Curve replace the track from the first marker onward** and force linear easing for exact constant speed. Hand-keyed frames before the first marker are left alone. **[by design]**

Duplicate model instances (same model loaded more than once)

See Model loaded multiple times.

- Object-level spin/orbit schedules and the camera-follow target now resolve the **correct** duplicate via occurrence/display-name identity (persisted across reload). The only remaining name-by-first ambiguity is the **cross-instance clipboard**, which isn't built yet (its design already uses occurrence identity). **[mostly fixed]**

Rendering & Export

See Export · Feedback.

- **Feedback forces single-slot (non-pipelined) export** — 4444/422 exports run a bit slower with feedback enabled. **[by design, performance]**
- **HDR reflections still appear over a solid background** — the reflection isn't masked out when the background is a solid color. *Workaround: set IBL intensity to 0.* **[WAI]**

Inspector / UI

See Model Inspector.

- **Euler X rotation is limited to $\pm 90^\circ$ near the poles** (gimbal lock); Y and Z cover the full $\pm 180^\circ$ cleanly. **[by design, math]**

Other

- **Cross-instance keyframe paste matches tracks by name** — pasting keyframes into a *second* app instance resolves the target object/group by name, so a duplicated single-mesh object can land on

(Cross-instance copy/paste itself — both coordinates and keyframes — is built and works between two running instances.)

Not built yet (planned)

- **Forward Kinematics** — walk/wave Animation-Path preset helpers, and a hierarchy-preserving Glue export so complex rigs stay articulated. **[not built]**
